TBD LABS

Technology Beyond Dimensions

CODEX RAPID DEVELOPMENT GUIDE

7-page informative company website • Product/engineering specification • Codex-ready workflow

Purpose: Give Codex enough persistent product, design, content, architecture, and acceptance criteria to build the first production-quality TBD Labs website quickly without turning the project into a collection of disconnected pages.

Prepared for the TBD Labs founding team

September 2026

1. Project Brief

Company: TBD Labs

Slogan: Technology Beyond Dimensions

Website type: Informative corporate technology website

Primary goal: Establish credibility, explain capabilities, showcase selected work, and generate project enquiries.

Initial pages: Home, About, Services, Projects, Technology, Insights, Contact.

Primary audience: Potential clients, startups, businesses, collaborators, students/developers, and people researching TBD Labs.

Secondary goal: Create a foundation that can later support case studies, articles, client logos, careers, and product landing pages.

Recommended positioning

TBD Labs should feel like a small but serious product-and-engineering company—not a generic freelance agency. The site should communicate capability without making unsupported claims about scale, clients, years of experience, or results.

Recommended visual direction

- **Style:** modern engineering / AI startup, editorial typography, spacious layouts, subtle motion.
- **Base:** near-black or very dark neutral with white/light typography.
- **Accent:** one distinctive brand accent; keep it consistent throughout the interface.
- **Imagery:** product screenshots, abstract technology visuals, diagrams, and real project imagery where available.
- **Avoid:** excessive gradients, stock-photo people shaking hands, generic “we are innovative” copy, excessive glassmorphism, and animation that hurts readability.

> Codex is designed for end-to-end coding work, and current OpenAI guidance emphasizes persistent repository instructions such as AGENTS.md, contextual documentation, and iterative validation.

2. Codex Development Strategy

The fastest reliable approach is not one enormous prompt. Give Codex a stable project brief, then work in controlled implementation phases. Codex can write, review, debug, and ship code, and current guidance recommends using repository-level instructions while avoiding unnecessary context bloat.

Repository setup

- **Framework:** Prefer Next.js + TypeScript for a content-heavy, SEO-friendly corporate site. If the team already has a preferred stack, preserve it rather than introducing unnecessary migration work.
- **Styling:** Tailwind CSS or the project's existing design system.
- **Icons:** Use one icon library consistently.
- **Animation:** CSS transitions first; add Framer Motion only where it materially improves the experience.
- **Content:** Keep copy in structured data/components where practical so pages remain easy to update.
- **Deployment:** Vercel is a natural option for a Next.js site, but deployment should remain independent of the content architecture.

Recommended repository structure

CODEX PROMPT

```
Create a clean structure similar to: app/ page.tsx about/page.tsx services/page.tsx
projects/page.tsx technology/page.tsx insights/page.tsx contact/page.tsx components/
layout/ sections/ ui/ content/ projects/ insights/ lib/ public/ styles/ tests/
AGENTS.md Adapt this to the chosen framework and existing repository rather than
blindly recreating folders.
```

AGENTS.md should contain

- TBD Labs brand name and slogan.
- Audience and website goals.
- Approved page routes.
- Design rules and accessibility requirements.
- Tone of voice and copy restrictions.
- Component/reuse conventions.
- Testing and validation commands.
- Rules for image usage and attribution.
- Instruction to avoid inventing client names, statistics, certifications, awards, or case-study results.

Suggested implementation sequence

1. Initialize or inspect the repository and existing tooling.
2. Create AGENTS.md and the global design system.
3. Build shared layout: header, footer, navigation, buttons, typography, containers.
4. Build Home and validate responsiveness.
5. Build About and Services using reusable sections.
6. Build Projects and Technology.
7. Build Insights and Contact.
8. Add SEO metadata, sitemap, robots, Open Graph data, accessibility improvements, and structured validation.
9. Run lint/typecheck/tests/build, fix failures, then perform a visual QA pass.
10. Commit coherent milestones rather than one giant unreviewed change.

3. Global Design System

These rules apply to every page unless a page-specific section explicitly overrides them.

Brand

- **Brand:** TBD Labs
- **Slogan:** Technology Beyond Dimensions
- **Voice:** confident, intelligent, concise, human, technically credible.
- **Copy principle:** explain what TBD Labs actually does; avoid inflated agency language.

Typography

- Use one display/heading family and one highly readable body family, or one versatile family with carefully selected weights.
- Large hero heading should be visually dominant without taking over the viewport.
- Body text should remain comfortable on desktop and mobile; avoid very small text.
- Use consistent heading hierarchy for accessibility and SEO.

Layout

- Use a consistent max-width container.
- Use generous vertical rhythm between sections.
- Prefer 12-column desktop grids and stacked mobile layouts.
- Maintain strong alignment between text, cards, media, and section headings.

Motion

- Page-load reveals should be subtle and short.
- Hover effects should communicate interactivity.
- Respect prefers-reduced-motion.
- No essential information should depend on animation.

Accessibility and quality

- Semantic HTML and logical heading hierarchy.
- Keyboard-accessible navigation and forms.
- Visible focus states.
- Sufficient color contrast.
- Alt text for meaningful images; decorative imagery should be marked appropriately.
- Responsive behavior from small mobile screens through large desktop displays.
- No horizontal overflow.

4. Home Page — /

Objective: Create the strongest first impression and quickly answer: who is TBD Labs, what does it build, and how can a visitor engage?

Recommended sections

- **Announcement/utility bar (optional):** use only for genuinely useful information.
- **Navbar:** logo/wordmark, seven routes, Contact CTA, responsive mobile menu.
- **Hero:** “Technology Beyond Dimensions” with concise supporting statement and two CTAs.
- **Capability snapshot:** Web, Mobile, AI/ML, UI/UX, Software Solutions.
- **Selected work:** 3–4 project cards with screenshots.
- **How we work:** Discover → Design → Build → Deploy → Improve.
- **Technology strip:** only technologies the team genuinely uses.
- **Final CTA:** project enquiry.

Primary CTA: Start a conversation

Acceptance criteria

- Hero communicates TBD Labs and its value within seconds.
- Project cards link to valid project detail or anchored sections.
- All CTAs have clear hover/focus states.
- Mobile navigation is usable with keyboard and touch.
- No unsupported metrics or invented client logos.

CODEX PROMPT

```
Build the TBD Labs homepage using the established design system. Make it feel like a premium modern technology company, not a template. Use the exact brand name “TBD Labs” and slogan “Technology Beyond Dimensions.” Create reusable sections for hero, capabilities, selected projects, process, technology, and CTA. Use realistic placeholder project data only where actual content is unavailable, clearly structured so it can be replaced later. Prioritize responsive layout, accessibility, performance, and strong visual hierarchy. Run the relevant checks after implementation.
```

5. About Page — /about

Objective: Explain the company story, mission, vision, founders, and principles without overclaiming.

Recommended sections

- **Intro:** TBD Labs / Technology Beyond Dimensions.
- **Story:** why the company exists and the type of problems it wants to solve.
- **Mission and vision:** short, specific statements.
- **Founders:** Bidur, David, Tumyang; use verified roles and bios only.
- **Values:** innovation, quality, collaboration, transparency, continuous learning.
- **CTA:** explore services or contact.

Primary CTA: Meet our capabilities / Contact us

Acceptance criteria

- Founder information is editable and does not invent credentials.
- Story is concise and believable.
- The page works without large profile images.
- Mission/vision are distinct rather than repetitive.
- Responsive founder cards remain readable on mobile.

CODEX PROMPT

```
Implement the TBD Labs About page using the existing layout and design tokens. Write
concise company copy around the idea of building digital products beyond conventional
boundaries, but do not invent history, awards, clients, revenue, team size, or years
of experience. Create editable founder cards for Bidur, David, and Tumyang with role
placeholders where information is not yet confirmed. Keep the page visually strong and
human.
```

6. Services Page — /services

Objective: Turn TBD Labs capabilities into understandable service offerings for potential clients.

Recommended sections

- **Hero:** a clear statement about turning ideas into digital products.
- **Service grid:** Web Development, Mobile Development, AI & Machine Learning, UI/UX Design, Software Development, Digital Solutions.
- **Service details:** each service explains deliverables, typical use cases, and relevant technologies.
- **Process:** discovery, design, engineering, QA, deployment, iteration.
- **CTA:** describe a project.

Primary CTA: Discuss a project

Acceptance criteria

- Each service is understandable to a non-technical client.
- Technical terms are explained or used sparingly.
- Service cards use consistent visual treatment.
- No claims about guarantees or results.
- CTA is repeated at an appropriate final section.

CODEX PROMPT

```
Build the TBD Labs Services page. Use six service categories: Web Development, Mobile
Development, AI & Machine Learning, UI/UX Design, Software Development, and Digital
Solutions. Give each a concise client-oriented explanation, example deliverables, and
suitable technologies without claiming expertise in tools the team has not confirmed.
Add a clear process section and a project enquiry CTA. Reuse components instead of
duplicating markup.
```

7. Projects Page — /projects

Objective: Demonstrate real work and create a scalable home for future case studies.

Recommended sections

- **Hero:** “What we build” or similar.
- **Project grid:** image, title, one-line description, category, technologies, status.
- **Featured projects:** KrishiMitra, BhramGuard, AutoRent where appropriate and factually accurate.
- **Project detail:** allow future dedicated case-study routes.
- **CTA:** start a project.

Primary CTA: Start a project

Acceptance criteria

- Projects are sourced from real work or explicitly labeled concepts.
- No fabricated client outcomes, user counts, revenue, awards, or performance figures.
- Cards are keyboard accessible.
- Images have appropriate aspect ratios and loading behavior.
- Project data is separated from presentation components where practical.

CODEX PROMPT

```
Build a scalable Projects page for TBD Labs. Use structured project data so new
projects can be added without rewriting the layout. Include fields for title,
category, summary, technologies, image, status, and optional detail URL. Use only
verified information for existing projects such as KrishiMitra, BhramGuard, and
AutoRent; leave unknown fields editable. Add polished project cards, responsive
filtering only if it improves usability, and a strong final CTA.
```

8. Technology Page — /technology

Objective: Show the engineering approach and technology ecosystem without turning the page into a logo wall.

Recommended sections

- **Hero:** “Built with modern technology.”
- **Frontend:** React/Next.js/TypeScript where actually used.
- **Backend:** Node.js/Express/Python/FastAPI where actually used.
- **Data:** PostgreSQL, MongoDB, or other verified technologies.
- **AI/ML:** Python, PyTorch, TensorFlow, LLM APIs where relevant.
- **Cloud/DevOps:** deployment and tooling the company genuinely uses.
- **Engineering principles:** maintainability, security awareness, testing, performance, accessibility.

Primary CTA: Talk to our team

Acceptance criteria

- Technologies are grouped logically.
- The page does not imply certification or mastery merely from listing a tool.
- Technology cards remain readable without excessive logos.
- The page communicates engineering principles, not just a stack.

CODEX PROMPT

```
Implement the TBD Labs Technology page. Present the stack by capability rather than as
a giant logo wall. Use verified technologies only and keep the content easy to edit.
Include frontend, backend, data, AI/ML, and cloud/devops categories, plus a short
engineering-principles section covering maintainability, testing, accessibility,
security awareness, and performance. Keep the visual style consistent with the rest of
the site.
```

9. Insights Page — /insights

Objective: Create an editorial area that can support SEO, thought leadership, project stories, and technical writing.

Recommended sections

- **Hero:** concise editorial introduction.
- **Featured article:** one prominent article/card.
- **Article grid:** technology, AI/ML, cybersecurity, development, project stories.
- **Metadata:** category, date, reading time only when available.
- **Future-ready:** structure content so Markdown/MDX or a CMS can be introduced later.
- **Newsletter/contact CTA:** optional; avoid collecting data until an actual workflow exists.

Primary CTA: Explore insights

Acceptance criteria

- Articles are genuine and not placeholder lorem ipsum.
- Dates and authors are accurate.
- Article cards have semantic links.
- The architecture can later support dynamic article pages.
- SEO metadata is prepared for future content.

CODEX PROMPT

```
Build the TBD Labs Insights page as an editorial hub. Create a structured article
model that can later be backed by Markdown/MDX or a CMS. Use a few clearly labeled
starter article records only if real content is supplied; otherwise create a polished
empty state that explains what readers will find here. Design for SEO, accessibility,
responsive cards, and future individual article routes. Avoid fake publication dates
or invented authors.
```

10. Contact Page — /contact

Objective: Make contacting TBD Labs straightforward while presenting a trustworthy, professional final step.

Recommended sections

- **Hero:** “Let’s build something beyond.”
- **Intro:** invite project ideas, software problems, partnerships, or general enquiries.
- **Form:** name, email, company/organization, service, project details.
- **Contact details:** use verified company email and social links only.
- **Response expectations:** avoid promising a response time unless the company establishes one.
- **Success/error states:** accessible and clear.
- **Privacy:** add a privacy notice when the form actually stores or processes submissions.

Primary CTA: Send enquiry

Acceptance criteria

- Form has labels, validation, focus management, and useful error messages.
- No fake submission success.
- Email destination is configurable via environment variables or backend settings.
- Spam protection can be added without harming accessibility.
- Contact information is real and editable.

CODEX PROMPT

```
Implement the TBD Labs Contact page. Build an accessible project enquiry form with
name, email, company/organization, service, and project details. Keep submission logic
separated from the UI so the email provider or API can be changed later. Use a clearly
configurable destination rather than hardcoding a personal email address. Include
robust loading, success, and error states, and do not display a successful submission
message unless the request actually succeeds.
```

11. Cross-Page Engineering Requirements

SEO

- Unique title and meta description for every page.
- Canonical URLs where appropriate.
- Open Graph/Twitter-style social metadata.
- Sitemap and robots configuration.
- One clear H1 per page.
- Descriptive internal links.
- Organization/site structured data only when the information is accurate.

Performance

- Optimize image sizes and use modern formats where supported.
- Lazy-load below-the-fold media where appropriate.
- Avoid shipping unnecessary JavaScript.
- Prefer server-rendered/static content when supported by the chosen framework.
- Use font loading carefully.

Security and privacy

- Do not expose secrets in client-side code.
- Use environment variables for external services.
- Validate and sanitize contact form input server-side.
- Avoid collecting unnecessary personal information.
- Add privacy/legal pages when required by the actual data flow and jurisdiction.

Testing

- Typecheck.
- Lint.
- Production build.
- Component/unit tests for important interactive behavior.
- Basic end-to-end checks for navigation and contact form states.
- Responsive visual QA at mobile, tablet, laptop, and large desktop widths.

12. Master Codex Prompt

This is the starting prompt for a fresh repository. After the first pass, use smaller page-specific prompts from this document rather than repeatedly sending the whole brief.

CODEX PROMPT

```
You are building the official TBD Labs company website. BRAND - Company: TBD Labs -
Slogan: Technology Beyond Dimensions - Website type: informative technology company
website - Primary purpose: establish credibility, explain capabilities, showcase work,
and generate enquiries. PAGES - / - /about - /services - /projects - /technology -
/insights - /contact DESIGN Create a premium modern technology-company interface.
Favor strong typography, generous spacing, dark neutral foundations with one
consistent accent, subtle borders, restrained motion, strong responsive behavior, and
excellent accessibility. Avoid generic agency templates and excessive visual effects.
CONTENT Do not invent clients, awards, certifications, statistics, user counts,
revenue, years of experience, or project outcomes. Where factual content is missing,
create clearly editable placeholders or omit the claim. ENGINEERING - Use reusable
components. - Keep content/data separate from presentation where practical. - Use
semantic HTML. - Make navigation keyboard accessible. - Respect prefers-reduced-
motion. - Optimize images and avoid unnecessary client-side JavaScript. - Keep secrets
out of source code. - Make external integrations configurable. - Add metadata,
sitemap, robots, and social metadata. - Validate with lint, typecheck, tests, and
production build. WORKFLOW First inspect the repository and existing tooling. Preserve
useful existing configuration. Create or update AGENTS.md with project-specific
instructions. Then implement the shared design system and layout before the individual
pages. Work incrementally and validate each milestone. Do not rewrite working code
unnecessarily. QUALITY BAR The final website should feel coherent across all seven
pages, work on mobile and desktop, have no dead links, have no console errors, and be
easy for another developer to maintain.
```

After the master pass, ask Codex to review the whole site against the acceptance criteria in this document and fix discrepancies rather than simply declaring the work complete.

13. Final QA Prompt for Codex

CODEX PROMPT

```
Perform a complete production-readiness review of the TBD Labs website. Check: 1. Every required route exists and renders. 2. Header/footer/navigation are consistent. 3. Mobile navigation works. 4. All internal links resolve. 5. There are no placeholder lorem ipsum sections. 6. No unsupported factual claims were introduced. 7. Typography hierarchy is consistent. 8. Responsive layouts work from small mobile through large desktop. 9. Images have appropriate alt text and loading behavior. 10. Keyboard navigation and focus states work. 11. Reduced-motion behavior is respected. 12. Forms have accessible labels, validation, loading, success, and error states. 13. Page metadata is unique and sensible. 14. Sitemap and robots configuration are correct for the chosen deployment. 15. Lint, typecheck, tests, and production build pass. 16. Remove dead code and obvious unnecessary dependencies. 17. Check for console errors and hydration issues. 18. Review visual consistency across all seven pages. Fix issues you find. Do not merely report them. Re-run validation after fixes and summarize only the remaining issues.
```

Visual QA prompt

CODEX PROMPT

```
Review the website as a product designer and frontend engineer. Compare every page against the TBD Labs design system: spacing, typography, alignment, visual hierarchy, component consistency, responsive behavior, contrast, and CTA clarity. Identify the highest-impact visual problems, fix them directly, then re-check all pages. Avoid adding decorative effects unless they improve communication.
```

14. Launch Checklist

- Brand name and slogan are correct everywhere.
- Founder names/roles are verified.
- Company email and social links are real.
- Domain is configured.
- Favicon and social preview image exist.
- SEO titles/descriptions are reviewed.
- Sitemap and robots are deployed.
- Contact form is connected and tested end-to-end.
- Privacy/legal requirements are reviewed for actual data collection.
- Analytics is added only if desired and configured appropriately.
- Images have correct licensing/usage rights.
- Production build passes.
- Mobile QA passes.
- Desktop QA passes.
- 404 page exists.
- No secrets are committed.
- Git working tree is clean after the final reviewed commit.

Recommended Codex operating pattern

Use Codex as an engineering agent, but keep human review around brand decisions, factual company claims, external-facing copy, legal/privacy requirements, and final visual direction. Current OpenAI guidance emphasizes contextual repository instructions and avoiding unnecessarily bloated persistent prompts; this guide therefore separates stable rules from page-specific implementation tasks.

Useful official references

OpenAI's current Codex documentation describes Codex as a coding agent for writing, reviewing, debugging, and shipping software. The current guidance also covers AGENTS.md, agentic workflows, and frontend quality.

Sources: OpenAI Developers — Code generation; OpenAI Developers — Codex; OpenAI model guidance; OpenAI Help Center — Using Codex with your ChatGPT plan.

End state

> The finished V1 should present TBD Labs as a credible technology company with a coherent brand, clear services, genuine project evidence, an extensible content architecture, and a frictionless route from first visit to project enquiry.
